

Letters to the Editor ...

Re: Unleaded Petrol

Dear Duncan: Congratulations on publishing the excellent article, titled "The Lies of Unleaded Petrol" (Part 1) (April-May '95). There are a couple of considerations in the whole argument about leaded/unleaded petrol which have been ignored by the media (or perhaps we should say proscribed by the media bosses).

One is that it takes more oil to produce a given quantity of unleaded petrol than it does for the same amount of leaded petrol. This means that the oil companies have to produce more oil and, reluctantly, make more money.

Leaded vehicles run quite satisfactorily (and more efficiently) on "Gasohol"—a blend of unleaded petrol and ethanol. Two years ago I wrote to the Democrats in Parliament House on the virtues of gasohol and received a reply from Sen. Coulter who said, in effect, that he already knew all about gasohol and the Democrats would be pushing for its introduction. However, nothing seems to have happened in this regard. Could it be that the oil companies are blocking its introduction so that they can maximise oil production? (Had the Democrats pushed the issue hard and loud it may have slowed the migration of their voters to the Greens.)

A second consideration concerns the carcinogenic qualities of additives to unleaded fuel and the article discusses this in detail. However, an aspect rarely brought out is that the drug companies are arms of the petrochemical transnationals. Logically, it is good business to produce products which make people sick because their drug companies will later make a fortune selling courses of expensive (and futile) drugs. Is it unreasonable to believe that the petrochemical cartels have done cost-benefit analyses along these lines?

Regards, Ron H., Tweed Heads, NSW, Australia.

Re: Gulf War Syndrome

Dear Editor: A number of sources have reported that vaccines and immunisations received by US soldiers are the chief suspected culprits for the Gulf War Syndrome.

The concept of a vaccine is to stimulate a person's immune system to become stronger by subjecting it to a weak assault. In an environment which has deteriorated to a state where immune systems are working overtime to maintain health, the vaccination approach may no longer be a good idea. Since sources of stress

accumulate, a certain vaccination may be the straw that breaks the camel's back, resulting in an immune-system deficiency instead of a stronger immune system.

In the case of the Gulf War veterans, vaccinations may only be a component of the problem because veterans not subjected to experimental US vaccines are also experiencing the GWS, according to an editor's note following "Gulf War Guinea Pigs" (NEXUS, April-May '95).

A possible contributor to the GWS may be friendly fire from an electronic battlefield which so zapped the Iraqi troops that they showed no fighting ability at all. In addition, *Defense News* (April 13-19, 1992) reported that an EMP weapon designed to mimic the flash of electricity from a nuclear explosion was used in the Gulf War.

Another indication of an adverse energy environment, reported by *USA Today* (May 26, 1994), indicated that 14,000 detectors designed to sense hostile chemicals and biological substances sounded up to three times a day during the war, while secondary verification procedures were unable to confirm the presence of such agents. Since the GWS has AIDS-like characteristics, it might be recalled that a declining immune system which first affected significant numbers of people was associated with surviving the immediate effects of radiation from an atomic blast.

Besides avoiding subjecting people to adverse environments, it may be desirable to consider techniques other than vaccines to strengthen the immune system—like the example mentioned in "Paramagnetic ELF Forces" (*Acres, USA*, April 1995). Apparently a Jewish high priest during the time of Christ would wear a long ribbon of cloth (wool-linen or burlap), called a Shatnez, soaked in sea water, so that he could safely examine lepers. The Shatnez prevented the disease from being kindled in the high priest by altering the flow of energy.

Sincerely, Paul S., Kansas City, MO, USA.

Re: Spiritual Service

Dear Duncan: Recently I read in a book that only 20 per cent of what Jesus said in the Bible he actually said. One of the things he did not say is "I am the Truth, the Way and the Life. The only way to the Father is through Me".

If this research is true and accurate, I don't think it will circulate far in

the Christian community. Is it not interesting that people believe the truth only if it doesn't interfere with what they want to believe?

Instead of worshipping and praying endlessly, I have a spiritual method where I project with my mind and soul the best love, intelligence and creativity I have to all life in the Universe to contribute to the Universe instead of being parasitic on it the way mankind has been till now.

How many other people do this? I would like to know. I believe this method of spiritual service will be the coming thing in the new age.

Yours sincerely, Gordon R., Christchurch, New Zealand.

(Dear Gordon: I don't believe mankind is parasitic, any more than a child sucking on its mother's breast is. Mankind is young, growing and learning. Your contribution to the Universe, though, is the reason I chose your letter to publish. Thank you, and keep it up! Ed.)

Re: Vaccination Dangers

Dear Duncan: I would really like to congratulate you and your team on a great magazine. My husband and I are recent converts and look forward to each issue with avid interest.

I have been particularly interested in the various articles you have printed on the vaccination issue. This subject is close to my heart because my young son is now disabled and suffers chronic ill-health due to vaccination. His reactions were immediate and severe, and have left me a very frustrated, disillusioned and angry mother. I grieve for the normal, healthy toddler I once had, whilst still loving the beautiful rare flower that is now my little boy.

I cannot stress strongly enough that parents of today need to make informed decisions when it comes to the question of immunisation. There is a wealth of reading material giving the other side of the argument which is never presented to the public by health officials and governments.

There are many children who are similarly affected like my son. Because reporting of adverse reactions is not compulsory, and because of the fact that many doctors do not recognise true contraindications when they occur, the government does not have a true picture statistically of just how dangerous and far-reaching the effects of vaccines are.

If parents choose to vaccinate, ask about side-effects, tell doctors of any allergies to drugs, and any history of eczema, asthma, epilepsy or convulsions in the family. It may just save

your child's life.

If you feel vaccination is not for your children, don't be bulldozed or intimidated by health providers. Remember, they are being paid a \$6 incentive for each child they recruit. Perhaps the well-being of our children will be set aside because of this monetary exercise.

There is also another aspect to all this. According to Federal Health Department publications, not all practitioners store vaccines correctly, and quite often the "cold chain" is not maintained. Also, many doctors inject into the wrong site, do not diagnose contraindications or misdiagnose those symptoms which are not "true contraindications. This does not exactly engender confidence in an already faltering health service.

So I say to all responsible parents, read all you can, soak up information like a sponge, then make this all-important decision. Your children's health, development and well-being will rely on this.

Yours faithfully, Kim S., Warburton, Victoria, Australia.

Re: Relativity Values

Dear Sir: I am writing with regard to an article in the June-July 1995 edition, titled "The Adams Superpower Multi-polar Magnet".

In this article, Robert Adams takes shots at Einstein's theories of relativity which, dare I say, seems ridiculous. Were Robert Adams to take the time he would find that the science of Geometro-dynamics (the behavioural study of space-time), which is built solely on the theory of general relativity, is 100 per cent in support of his own views.

I am a great fan of both Robert Adams and Albert Einstein—whom I think would have enjoyed witnessing Robert Adams' work.

Sincerely, Riki M., Wellington, New Zealand.

Re: Cruelty to Animals

The Australian Association for Humane Research is joining other groups throughout the world to protest against Gillette's refusal to stop using animals in outdated and cruel animal tests. In fact, Gillette's animal use is on the rise: the number of animals tortured and killed has more than doubled since 1987.

With our new balcony banner, "Gillette Tortures Animals", we hope to draw people's attention to the company's intransigence and thus put further pressure on them to abandon the practice.

... more Letters to the Editor

NB: Please keep letters to approx. 100-150 words in length. — Ed.

The huge Washington-based group, People for the Ethical Treatment of Animals, has collected incontrovertible proof of Gillette's use of secret contractors to test their products on animals. Contrary to Gillette's claims, there is no legal requirement by the American Consumer Product Safety Commission that "requires any firm to perform animal tests".

Gillette's hypocritical claims that they do not test products on animals must be exposed.

Re: Success in HIV Reversal

Dear Duncan: As you will be aware by the news release issued from our office, clinical trials conducted at Bastyr University, Seattle, Washington, USA, have proved positive in reversing HIV using the "LISTEN" System.

Dr Barbara Brewitt, Ph.D., the researcher responsible, has been invited to Australia to present her paper to the Electromedical Conference '95.

Assuming that this apparent breakthrough would be of considerable interest to the people involved in the HIV/AIDS scene, we contacted three separate organisations and were amazed at the lack of interest!

Our quest was to find an organisation within Australia that would be capable of undertaking a 'validation' program to duplicate and possibly expand on Dr Brewitt's work.

We offered to make a System available and train suitably qualified practitioners on its use. Further, we sought their assistance in advising us who or which organisations may wish to hear Dr Brewitt's presentation.

Alas, stony silence! Not one has had the courtesy to acknowledge the offer or the invitation.

One can only wonder how the people living with HIV would react to the neglect of their interests by these so-called representative bodies, by ignoring the opportunity to explore the validity of a potentially safe, non-invasive and drug-free solution to their illness. I would be grateful if any of your readers who may be living with HIV could tell us where we have erred in our approach to this matter.

Yours sincerely,

Max Hamilton, Director, Health Through Technology Pty Ltd, Level 67, MLC Centre, Martin Place,

Sydney, NSW 2000, Australia, phone +61 (02) 238 6153, fax (02) 238 7633.

(Dear Max: Thank you for your letter. I'm not surprised that the AIDS organisations you contacted did not want to know of your success with treating HIV. A few years ago NEXUS organised the Australian lecture tour of Ed McCabe, well-known investigative journalist in the field of oxygen therapies. We invited all the media and the AIDS councils in Australia to come and view the medical documentation showing several people who had gone from HIV-positive to HIV-negative as a primary result of oxygen therapies. They were clearly not interested, and in most cases were incredibly hostile that we even wasted their time! I wonder what the HIV-positive people would have to say about that! Good luck in your research. Ed.)

Re: Fluoride's Hidden Agenda

Dear Duncan: I read with great interest the recent article in NEXUS (vol. 2#27) on Fluoride with respect to the "crowd control" agenda.

As a homoeopath I'd like to draw attention to the emergence of other post-war syndromes and their correspondence to various rubrics in the *Materia Medica*, as under "Fluoricum Acidum":

"Increasing Divorce Rate: 'aversion to parents, friends, members of family, wife'; 'delusion: betrothal must be broken/children must be driven out of home/marriage must dissolve'; 'desire for solitude'; 'indifference to: business affairs/important things/loved ones/relations'."

"Hyperactivity and Attention Deficit Syndrome: 'capricious'; 'difficult concentration'; 'confusion of mind'; 'excitable, exhilarated'; 'forgetful'; 'weakness of memory for: business/ dates/what was about to do/for what has just done/for proper names/for what has just thought'; 'mistakes in speaking, writing, spelling'; 'thoughts intrude and crowd in on each other'; 'thoughts rush and flow in'."

I think the agenda is broader than mere crowd control!

Sincerely, Patricia H., Kenmore Hills, Qld, Australia.

Re: Mobile Phone Radiation

Dear Duncan: It unfortunately seems that the future will bring with it a rash of mobile phone-induced brain tumours, the likes of which will make cigarette-smoking deaths look like a hobby. And when that happens, where will all the vested-interest people—who assured us the

phones were perfectly safe—be hiding then? They'll keep on denying any links to tumours until the evidence becomes unavoidably overwhelming. But by that time the number of dead people will also be overwhelming.

But what's so laughably stupid is that those money-hungry vested interests have to live on this planet too. Their actions would only make sense if their greedy ways were directed at a civilisation far enough removed for them never to be in personal danger of cellular radiation themselves. Remind you of the French?

While the phone wars continue and we take to these electronic phallic symbols like bees to honey, there are two ways you can reduce your personal risk while using a mobile. Either purchase a transportable phone which will keep the antenna several feet away from your head, or purchase an earphone kit for your handheld. This clever idea is available for selected mobiles and it allows you to plug a corded earphone/microphone into your mobile, allowing you to talk with the phone in your hand or pocket or belt.

Beware digital phones. Their power is much greater than analogue (2 watts versus 0.6 watts), although they only develop full power in bursts during speech mode.

In the last year, a Brisbane newspaper carried a one-paragraph story claiming that a Brisbane university was developing a shielded cellular antenna "for fear it can create brain cancer". Nothing has been heard since. Makes you wonder what we're not being told.

Most instruction manuals for mobiles carry a warning not to operate them within several feet of other people. But what about the poor operator? Doesn't he count? And anyway, if there's no radiation problem, why the warning? And isn't this warning an admission of guilt?

The future looks bleak!

Max L., Currumbin Waters, Queensland, Australia.

Re: Seismic Sensitivity

Dear Duncan: For some time, scientists have known that many forms of life, including some animals, birds, fish and insects, sense the electromagnetic field of the Earth, some even using this electromagnetic information to navigate.

Prior to large earthquakes, and for several days following a nuclear test, the Earth's electromagnetic field is known to become disturbed in the Extremely Low Frequency part of

the spectrum. Animals and birds sensitive to changes in the Earth's electromagnetic field are known to appear disturbed or have difficulty navigating, often becoming lost prior to major seismic activity.

I believe many people are seismically sensitive also, experiencing a range of symptoms prior to major seismic activity and for a few days following a nuclear test anywhere in the world, e.g., wandering or unusual pains, flu-like symptoms, nausea and an increased sensitivity to light or noise, to name a few. I am one such person and am presently researching this phenomenon. If any of your readers are sensitive to seismic activity or have any information regarding seismic sensitivity in man, bird or beast, I would appreciate hearing from you.

Yours sincerely,

N. G., Seismic Research, PO Box 1058, Horsham, Vic. 3402, Australia.

Re: Grey Men and the NWO

Dear Sir: Hello to you and your lady. I've been a reader of NEXUS since 1989 and have been more than impressed with your information.

My interest is of the "Grey Men", and this "One World Order"—anything along those lines. I'm thankful you provide many answers for me. The powers-that-be do a good job of keeping the normal person in the street blinded. Having worked in witness protection in Australia, I have some idea about secrets.

Anyway, in your mag, Autumn 1987, issue no. 1, there was an article headed "The Gemstone File". Do you know where I can purchase that file or book? The pieces of the puzzle are coming together. Have you read *The Lost Waltz of the Tyrants* by Judy Pope Koteen? Bob Woodward's *Veil: The Secret Wars of the CIA, 1981-1987*? Do you know who the Grey Men are?

Keep up the great work. My spirit is strong and I have faith. May you grow in wisdom.

Mike P., Whitianga, New Zealand.

(Dear Mike: So many questions! You can purchase The Gemstone File through AUP (see page 10). It's a great book. Australian and NZ readers might like to see a few of their favourite politicians' names linked to the drug trade. There is a lot in that book that I can't print, even though I would like to! As to your other questions, yes, I have read those titles you mention, and, no, I do not know who the Grey Men are. If or when I find out, though, I will list them in NEXUS! Ed.)
